

The Variation of Animals and Plants under Domestication (Cambridge Library Collection - Darwin, Evolution and Genetics)

Darwin (1809-1882) first published this work in 1868 in two volumes. The book began as an expansion of the first two chapters of *On the Origin of Species: Variation under Domestication and Variation under Nature* and it developed into one of his largest works; Darwin referred to it as his big book. In volume 2, concerned with how species inherit particular characteristics, Darwin first published his provisional hypothesis of pangenesis. This theory of gemmules was not met with much acceptance and today is not valuable as scientific explanation, but it was important in laying down the key questions that needed to be answered regarding the processes of genetic inheritance. Darwin also used volume 2 to challenge the theories of evolution by design, expounded by the botanist Asa Gray. Darwins arguments were some of the very first in a long debate that remains hot today.
