

The Skeleton of the Borophaginae (Carnivora, Canidae): Morphology and Function (UC Publications in Geological Sciences)

This book provides the first full description and analysis of the postcranial skeleton of the Tertiary canid subfamily Borophaginae. Borophagines have been stereotyped as noncursorial, bone-crushing scavengers, but comparisons with Recent digitigrade carnivores reveal a surprising diversity of habit among borophagines. The author relates functional characteristics to various aspects of borophagine paleoecology, including habitat, diet, social organization, and extinction.
